

Package ‘ResultModelManager’

August 13, 2024

Title Result Model Manager

Version 0.5.10

Description Database data model management utilities for R packages in the Observational Health Data Sciences and Informatics program <<https://ohdsi.org>>. 'ResultModelManager' provides utility functions to allow package maintainers to migrate existing SQL database models, export and import results in consistent patterns.

|-------------------|-------------------|
| ConnectionHandler | ConnectionHandler |
|-------------------|-------------------|

Description

Class for handling DatabaseConnector:connection objects with consistent R6 interfaces for pooled and non-pooled connections. Allows a connection to cleanly be opened and closed and stored within class/object variables

Value

DatabaseConnector Connection instance close Connection

boolean TRUE if connection is valid queryDb

boolean TRUE if connection is valid executeSql

Public fields

connectionDetails DatabaseConnector connectionDetails object

con DatabaseConnector connection object

isActive Is connection active or not#'

snakeCaseToCamelCase (Optional) Boolean. return the results columns in camel case (default)

Methods

Public methods:

- [ConnectionHandler\\$new\(\)](#)
- [ConnectionHandler\\$dbms\(\)](#)
- [ConnectionHandler\\$tbl\(\)](#)
- [ConnectionHandler\\$renderTranslateSql\(\)](#)
- [ConnectionHandler\\$initConnection\(\)](#)
- [ConnectionHandler\\$getConnection\(\)](#)
- [ConnectionHandler\\$closeConnection\(\)](#)
- [ConnectionHandler\\$finalize\(\)](#)
- [ConnectionHandler\\$dbIsValid\(\)](#)
- [ConnectionHandler\\$queryDb\(\)](#)
- [ConnectionHandler\\$executeSql\(\)](#)
- [ConnectionHandler\\$queryFunction\(\)](#)
- [ConnectionHandler\\$executeFunction\(\)](#)
- [ConnectionHandler\\$clone\(\)](#)

Method new():

Usage:

```
ConnectionHandler$new(
  connectionDetails,
  loadConnection = TRUE,
  snakeCaseToCamelCase = TRUE
)
```

Arguments:

connectionDetails DatabaseConnector::connectionDetails class

loadConnection Boolean option to load connection right away

snakeCaseToCamelCase (Optional) Boolean. return the results columns in camel case (default)
get dbms

Method dbms(): Get the dbms type of the connection get table

Usage:

```
ConnectionHandler$dbms()
```

Method tbl(): get a dplyr table object (i.e. lazy loaded)

Usage:

```
ConnectionHandler$tbl(table, databaseSchema = NULL)
```

Arguments:

table table name

databaseSchema databaseSchema to which table belongs Render Translate Sql.

Method renderTranslateSql(): Masked call to SqlRender

Usage:

```
ConnectionHandler$renderTranslateSql(sql, ...)
```

Arguments:

sql Sql query string

... Elipsis initConnection

Method initConnection(): Load connection Get Connection

Usage:

ConnectionHandler\$initConnection()

Method getConnection(): Returns connection for use with standard DatabaseConnector calls. Connects automatically if it isn't yet loaded

Usage:

ConnectionHandler\$getConnection()

Method closeConnection(): Closes connection (if active) close Connection

Usage:

ConnectionHandler\$closeConnection()

Method finalize(): Closes connection (if active) db Is Valid

Usage:

ConnectionHandler\$finalize()

Method dbIsValid(): Masks call to DBI::dbIsValid. Returns False if connection is NULL

Usage:

ConnectionHandler\$dbIsValid()

Method queryDb(): query database and return the resulting data.frame

If environment variable LIMIT_ROW_COUNT is set Returned rows are limited to this value (no default) Limit row count is intended for web applications that may cause a denial of service if they consume too many resources.

Usage:

```
ConnectionHandler$queryDb(
  sql,
  snakeCaseToCamelCase = self$snakeCaseToCamelCase,
  overrideRowLimit = FALSE,
  ...
)
```

Arguments:

sql sql query string

snakeCaseToCamelCase (Optional) Boolean. return the results columns in camel case (default)

overrideRowLimit (Optional) Boolean. In some cases, where row limit is enforced on the system You may wish to ignore it.

... Additional query parameters

Method executeSql(): execute set of database queries

Usage:

ConnectionHandler\$executeSql(sql, ...)

Arguments:

sql sql query string

... Additional query parameters query Function

Method queryFunction(): queryFunction that can be overridden with subclasses (e.g. use different base function or intercept query) Does not translate or render sql.

Usage:

```
ConnectionHandler$queryFunction(
  sql,
  snakeCaseToCamelCase = self$snakeCaseToCamelCase,
  connection = self$getConnection()
)
```

Arguments:

sql sql query string
 snakeCaseToCamelCase (Optional) Boolean. return the results columns in camel case (default)
 connection (Optional) connection object execute Function

Method executeFunction(): exec query Function that can be overridden with subclasses (e.g. use different base function or intercept query) Does not translate or render sql.

Usage:

```
ConnectionHandler$executeFunction(sql, connection = self$getConnection())
```

Arguments:

sql sql query string
 connection connection object

Method clone(): The objects of this class are cloneable with this method.

Usage:

```
ConnectionHandler$clone(deep = FALSE)
```

Arguments:

deep Whether to make a deep clone.

createQueryNamespace *Create query namespace*

Description

Create a QueryNamespace instance from either a connection handler or a connectionDetails object
 Allows construction with various options not handled by QueryNamespace\$new

Note - currently not supported is having multiple table prefixes for multiple table namespaces

Usage

```
createQueryNamespace(
  connectionDetails = NULL,
  connectionHandler = NULL,
  usePooledConnection = FALSE,
  tableSpecification = NULL,
  resultModelSpecificationPath = NULL,
  tablePrefix = "",
  snakeCaseToCamelCase = TRUE,
  ...
)
```

Arguments

| | |
|------------------------------|---|
| connectionDetails | An object of type connectionDetails as created using the createConnectionDetails function in the DatabaseConnector package. |
| connectionHandler | ResultModelManager ConnectionHandler or PooledConnectionHandler instance |
| usePooledConnection | Use Pooled database connection instead of standard DatabaseConnector single connection. |
| tableSpecification | Table specification data.frame |
| resultModelSpecificationPath | (optional) csv file or files for tableSpecifications - must conform to table spec format. |
| tablePrefix | String to prefix table names with - default is empty string |
| snakeCaseToCamelCase | convert snakecase results to camelCase field names (TRUE by default) |
| ... | Elipsis - use for any additional string keys to replace |

```
createResultExportManager
```

Create Result Export Manager

Description

For a give table specification file, create an export manager instance for creating results data sets that conform to the data model.

This checks that, at export time, internal validity is assured for the data (e.g. primary keys are valid, data types are compatible)

In addition this utility will create a manifest object that can be used to maintain the validity of data.

If an instance of a DataMigrationManager is present and available a packageVersion reference (where applicable) and migration set will be referenced. Allowing data to be imported into a database schema at a specific version.

Usage

```
createResultExportManager(
  tableSpecification,
  exportDir,
  minCellCount = getOption("ohdsi.minCellCount", default = 5),
  databaseId = NULL
)
```

Arguments

| | |
|--------------------|--|
| tableSpecification | Table specification data.frame |
| exportDir | Directory files are being exported to |
| minCellCount | Minimum cell count - recommended that you set with options("ohdsi.minCellCount" = count) in all R projects. Default is 5 |
| databaseId | database identifier - required when exporting according to many specs |

| | |
|----------------------|-----------------------------------|
| DataMigrationManager | <i>DataMigrationManager (DMM)</i> |
|----------------------|-----------------------------------|

Description

R6 class for management of database migration

Value

data frame all migrations, including file name, order and execution status Get connection handler

Public fields

migrationPath Path migrations exist in
 databaseSchema Path migrations exist in
 packageName packageName, can be null
 tablePrefix tablePrefix, can be empty character vector
 packageTablePrefix packageTablePrefix, can be empty character vector

Methods**Public methods:**

- `DataMigrationManager$new()`
- `DataMigrationManager$migrationTableExists()`
- `DataMigrationManager$getMigrationsPath()`
- `DataMigrationManager$getStatus()`
- `DataMigrationManager$getConnectionHandler()`
- `DataMigrationManager$check()`
- `DataMigrationManager$executeMigrations()`
- `DataMigrationManager$isPackage()`
- `DataMigrationManager$finalize()`
- `DataMigrationManager$clone()`

Method new():

Usage:

```
DataMigrationManager$new(
  connectionDetails,
  databaseSchema,
  tablePrefix = "",
  packageTablePrefix = "",
  migrationPath,
  packageName = NULL,
  migrationRegexp = .defaultMigrationRegexp
)
```

Arguments:

connectionDetails DatabaseConnector connection details object

databaseSchema Database Schema to execute on

tablePrefix Optional table prefix for all tables (e.g. plp, cm, cd etc)

packageTablePrefix A table prefix when used in conjunction with other package results schema, e.g. "cd_", "scs_", "plp_", "cm_"

migrationPath Path to location of migration sql files. If in package mode, this should just be a folder (e.g. "migrations") that lives in the location "sql/sql_server" (and) other database platforms. If in folder model, the folder must include "sql_server" in the relative path, (e.g if migrationPath = 'migrations' then the folder 'migrations/sql_server' should exists)

packageName If in package mode, the name of the R package

migrationRegexp (Optional) regular expression pattern default is (Migration_([0-9]+))-(.+).sql
Migration table exists

Method migrationTableExists(): Check if migration table is present in schema

Usage:

```
DataMigrationManager$migrationTableExists()
```

Returns: boolean Get path of migrations

Method getMigrationsPath(): Get path to sql migration files

Usage:

```
DataMigrationManager$getMigrationsPath(dbms = "sql server")
```

Arguments:

dbms Optionally specify the dbms that the migration fits under Get status of result model

Method getStatus(): Get status of all migrations (executed or not)

Usage:

```
DataMigrationManager$getStatus()
```

Method getConnectionHandler(): Return connection handler instance

Usage:

```
DataMigrationManager$getConnectionHandler()
```

Returns: ConnectionHandler instance Check migrations in folder

Method check(): Check if file names are valid for migrations Execute Migrations

Usage:

```
DataMigrationManager$check()
```

Method executeMigrations(): Execute any unexecuted migrations

Usage:

```
DataMigrationManager$executeMigrations(stopMigrationVersion = NULL)
```

Arguments:

stopMigrationVersion (Optional) Migrate to a specific migration number isPackage

Method isPackage(): is a package folder structure or not finalize

Usage:

```
DataMigrationManager$isPackage()
```

Method finalize(): close database connection

Usage:

```
DataMigrationManager$finalize()
```

Method clone(): The objects of this class are cloneable with this method.

Usage:

```
DataMigrationManager$clone(deep = FALSE)
```

Arguments:

deep Whether to make a deep clone.

See Also

[ConnectionHandler](#) for information on returned class

```
deleteAllRowsForDatabaseId
```

Delete all rows for database id

Description

Delete all rows for database id

Usage

```
deleteAllRowsForDatabaseId(
  connection,
  schema,
  tableName,
  databaseId,
  idIsInt = TRUE
)
```

Arguments

| | |
|------------|--|
| connection | DatabaseConnector connection instance |
| schema | The schema on the postgres server where the results table exists |
| tableName | Database table name |
| databaseId | Results source database identifier |
| idIsInt | Identified is a numeric type? If not character is used |

Details

Only PostgreSQL servers are supported.

```
deleteAllRowsForPrimaryKey
```

Delete results rows for primary key values from database server tables

Description

Delete results rows for primary key values from database server tables

Usage

```
deleteAllRowsForPrimaryKey(connection, schema, tableName, keyValues)
```

Arguments

| | |
|------------|--|
| connection | DatabaseConnector connection instance |
| schema | The schema on the postgres server where the results table exists |
| tableName | Database table name |
| keyValues | Key values of results rows to be deleted |

Details

Only PostgreSQL servers are supported.

```
generateSqlSchema
```

Schema generator

Description

Take a csv schema definition and create a basic sql script with it. returns string containing the sql for the table

Usage

```
generateSqlSchema(
  csvFilepath = NULL,
  schemaDefinition = NULL,
  sqlOutputPath = NULL,
  overwrite = FALSE
)
```

Arguments

| | |
|------------------|--|
| csvFilepath | Path to schema file. Csv file must have the columns: "table_name", "column_name", "data_type", "primary_key" |
| schemaDefinition | A schemaDefintiion data.frame' with the columns: tableName, columnName, dataType, isRequired, primaryKey |
| sqlOutputPath | File to write sql to. |
| overwrite | Boolean - overwrite existing file? |

grantTablePermissions *Grant Table Permissions*

Description

Grant a given permission for all tables on a given tableSpecification

Very useful if you're hosting studies on data.ohdsi.org or other postgresql instances

NOTE: only tested on postgresql, users' of other platforms may have Sql translation issues

Usage

```
grantTablePermissions(
  connectionDetails = NULL,
  connection = NULL,
  tableSpecification,
  databaseSchema,
  tablePrefix = "",
  permissions = "SELECT",
  user
)
```

Arguments

| | |
|--------------------|---|
| connectionDetails | An object of type connectionDetails as created using the createConnectionDetails function in the DatabaseConnector package. |
| connection | DatabaseConnector connection instance |
| tableSpecification | data.frame conforming to table spec (must contain tableName field) |
| databaseSchema | database schema to run this on |
| tablePrefix | String to prefix table names with - default is empty string |
| permissions | permissions to generate must be one of SELECT, INSERT, DELETE or UPDATE |
| user | database user to grant permissions to |

loadResultsDataModelSpecifications

Get specifications from a given file path

Description

Get specifications from a given file path

Usage

```
loadResultsDataModelSpecifications(filePath)
```

Arguments

filePath path to a valid csv file

Value

A tibble data frame object with specifications

PooledConnectionHandler

Pooled Connection Handler

Description

Transparently works the same way as a standard connection handler but stores pooled connections. Useful for long running applications that serve multiple concurrent requests. Note that a side effect of using this is that each call to this increments the .GlobalEnv attribute RMMPooledHandlerCount

Value

boolean TRUE if connection is valid executeSql

Super class

`ResultModelManager::ConnectionHandler` -> PooledConnectionHandler

Methods**Public methods:**

- `PooledConnectionHandler$new()`
- `PooledConnectionHandler$initConnection()`
- `PooledConnectionHandler$getCheckedOutConnectionPath()`
- `PooledConnectionHandler$getConnection()`
- `PooledConnectionHandler$dbms()`
- `PooledConnectionHandler$closeConnection()`
- `PooledConnectionHandler$queryDb()`
- `PooledConnectionHandler$executeSql()`
- `PooledConnectionHandler$queryFunction()`
- `PooledConnectionHandler$executeFunction()`
- `PooledConnectionHandler$clone()`

Method new():

Usage:

```
PooledConnectionHandler$new(
  connectionDetails = NULL,
  snakeCaseToCamelCase = TRUE,
  loadConnection = TRUE,
  dbConnectArgs = NULL,
  forceJdbcConnection = TRUE
)
```

Arguments:

connectionDetails DatabaseConnector::connectionDetails class
 snakeCaseToCamelCase (Optional) Boolean. return the results columns in camel case (default)
 loadConnection Boolean option to load connection right away
 dbConnectArgs Optional arguments to call pool::dbPool overrides default usage of connectionDetails
 forceJdbcConnection Force JDBC connection (requires using DatabaseConnector ConnectionDetails) initialize pooled db connection

Method `initConnection()`: Overrides ConnectionHandler Call Used for getting a checked out connection from a given environment (if one exists)

Usage:

```
PooledConnectionHandler$initConnection()
```

Method `getCheckedOutConnectionPath()`:

Usage:

```
PooledConnectionHandler$getCheckedOutConnectionPath()
```

Arguments:

.deferredFrame defaults to the parent frame of the calling block. Get Connection

Method `getConnection()`: Returns a connection from the pool When the desired frame exits, the connection will be returned to the pool As a side effect, the connection is stored as an attribute within the calling frame (e.g. the same function) to prevent multiple connections being spawned, which limits performance.

If you call this somewhere you need to think about returning the object or you may create a connection that is never returned to the pool.

Usage:

```
PooledConnectionHandler$getConnection(.deferredFrame = parent.frame(n = 2))
```

Arguments:

.deferredFrame defaults to the parent frame of the calling block. get dbms

Method `dbms()`: Get the dbms type of the connection Close Connection

Usage:

```
PooledConnectionHandler$dbms()
```

Method `closeConnection()`: Overrides ConnectionHandler Call - closes all active connections called with getConnection queryDb

Usage:

```
PooledConnectionHandler$closeConnection()
```

Method `queryDb()`: query database and return the resulting data.frame

If environment variable LIMIT_ROW_COUNT is set Returned rows are limited to this value (no default) Limit row count is intended for web applications that may cause a denial of service if they consume too many resources.

Usage:

```

PooledConnectionHandler$queryDb(
  sql,
  snakeCaseToCamelCase = self$snakeCaseToCamelCase,
  overrideRowLimit = FALSE,
  ...
)
```

Arguments:

sql sql query string

snakeCaseToCamelCase (Optional) Boolean. return the results columns in camel case (default)

overrideRowLimit (Optional) Boolean. In some cases, where row limit is enforced on the system You may wish to ignore it.

... Additional query parameters

Method executeSql(): execute set of database queries

Usage:

```
PooledConnectionHandler$executeSql(sql, ...)
```

Arguments:

sql sql query string

... Additional query parameters query Function

Method queryFunction(): Overrides ConnectionHandler Call. Does not translate or render sql.

Usage:

```
PooledConnectionHandler$queryFunction(
  sql,
  snakeCaseToCamelCase = self$snakeCaseToCamelCase,
  connection
)
```

Arguments:

sql sql query string

snakeCaseToCamelCase (Optional) Boolean. return the results columns in camel case (default)
query Function

connection db connection assumes pooling is handled outside of call

Method executeFunction(): Overrides ConnectionHandler Call. Does not translate or render sql.

Usage:

```
PooledConnectionHandler$executeFunction(sql, connection)
```

Arguments:

sql sql query string

connection DatabaseConnector connection. Assumes pooling is handled outside of call

Method clone(): The objects of this class are cloneable with this method.

Usage:

```
PooledConnectionHandler$clone(deep = FALSE)
```

Arguments:

deep Whether to make a deep clone.

QueryNamespace

QueryNamespace

Description

Given a results specification and ConnectionHandler instance - this class allow queries to be namespaced within any tables specified within a list of pre-determined tables. This allows the encapsulation of queries, using specific table names in a consistent manner that is straightforward to maintain over time.

Public fields

tablePrefix tablePrefix to use

Methods

Public methods:

- [QueryNamespace\\$new\(\)](#)
- [QueryNamespace\\$setConnectionHandler\(\)](#)
- [QueryNamespace\\$getConnectionHandler\(\)](#)
- [QueryNamespace\\$addReplacementVariable\(\)](#)
- [QueryNamespace\\$addTableSpecification\(\)](#)
- [QueryNamespace\\$render\(\)](#)
- [QueryNamespace\\$queryDb\(\)](#)
- [QueryNamespace\\$executeSql\(\)](#)
- [QueryNamespace\\$getVars\(\)](#)
- [QueryNamespace\\$finalize\(\)](#)
- [QueryNamespace\\$clone\(\)](#)

Method new(): initialize class

Usage:

```
QueryNamespace$new(
  connectionHandler = NULL,
  tableSpecification = NULL,
  tablePrefix = "",
  ...
)
```

Arguments:

connectionHandler ConnectionHandler instance @seealso [ConnectionHandler](#)

tableSpecification tableSpecification data.frame

tablePrefix constant string to prefix all tables with

... additional replacement variables e.g. database_schema, vocabulary_schema etc Set Connection Handler

Method setConnectionHandler(): set connection handler object for object

Usage:

```
QueryNamespace$setConnectionHandler(connectionHandler)
```

Arguments:

connectionHandler ConnectionHandler instance Get connection handler

Method getConnectionHandler(): get connection handler object or throw error if not set

Usage:

```
QueryNamespace$getConnectionHandler()
```

Method addReplacementVariable(): add a variable to automatically be replaced in query strings (e.g. @database_schema.@table_name becomes 'database_schema.table_1')

Usage:

```
QueryNamespace$addReplacementVariable(key, value, replace = FALSE)
```

Arguments:

key variable name string (without @) to be replaced, eg. "table_name"

value atomic value for replacement

replace if a variable of the same key is found, overwrite it add table specification

Method addTableSpecification(): add a variable to automatically be replaced in query strings (e.g. @database_schema.@table_name becomes 'database_schema.table_1')

Usage:

```
QueryNamespace$addTableSpecification(
  tableSpecification,
  useTablePrefix = TRUE,
  tablePrefix = self$tablePrefix,
  replace = TRUE
)
```

Arguments:

tableSpecification table specification data.frame conforming to column names tableName, columnName, dataType and primaryKey

useTablePrefix prefix the results with the tablePrefix (TRUE)

tablePrefix prefix string - defaults to class variable set during initialization

replace replace existing variables of the same name Render

Method render(): Call to SqlRender::render replacing names stored in this class

Usage:

```
QueryNamespace$render(sql, ...)
```

Arguments:

sql query string

... additional variables to be passed to SqlRender::render - will overwrite anything in namespace query Sql

Method queryDb(): Call to

Usage:

```
QueryNamespace$queryDb(sql, ...)
```

Arguments:

sql query string

... additional variables to send to SqlRender::render execute Sql

Method executeSql(): Call to execute sql within namespaced queries

Usage:

```
QueryNamespace$executeSql(sql, ...)
```

Arguments:

```
sql query string
```

```
... additional variables to send to SqlRender::render get vars
```

Method `getVars()`: returns full list of variables that will be replaced Destruct object

Usage:

```
QueryNamespace$getVars()
```

Method `finalize()`: Close connections etc

Usage:

```
QueryNamespace$finalize()
```

Method `clone()`: The objects of this class are cloneable with this method.

Usage:

```
QueryNamespace$clone(deep = FALSE)
```

Arguments:

```
deep Whether to make a deep clone.
```

Examples

```
library(ResultModelManager)

# Create some junk test data
connectionDetails <-
  DatabaseConnector::createConnectionDetails(
    server = "test_db.sqlite",
    dbms = "sqlite"
  )

conn <- DatabaseConnector::connect(connectionDetails)
DatabaseConnector::insertTable(
  connection = conn,
  tableName = "cd_cohort",
  data = data.frame(
    cohort_id = c(1, 2, 3),
    cohort_name = c("cohort one", "cohort two", "cohort three"),
    json = "{}",
    sql = "SELECT 1"
  )
)
DatabaseConnector::disconnect(conn)

connectionHandler <- ConnectionHandler$new(connectionDetails = connectionDetails)
tableSpecification <- data.frame(
  tableName = "cohort",
  columnName = c(
    "cohort_id",
    "cohort_name",
    "json",
    "sql"
  ),
)
```

```

    primaryKey = c(TRUE, FALSE, FALSE, FALSE),
    dataType = c("int", "varchar", "varchar", "varchar")
)

cohortNamespace <- QueryNamespace$new(
  connectionHandler = connectionHandler,
  tableSpecification = tableSpecification,
  result_schema = "main",
  tablePrefix = "cd_"
)
sql <- "SELECT * FROM @result_schema.@cohort WHERE cohort_id = @cohort_id"
# Returns : "SELECT * FROM main.cd_cohort WHERE cohort_id = @cohort_id"
print(cohortNamespace$render(sql))
# Returns query result
result <- cohortNamespace$queryDb(sql, cohort_id = 1)
# cleanup test data
unlink("test_db.sqlite")

```

ResultExportManager *Result Set Export Manager*

Description

EXPERIMENTAL - this feature is still in design stage and it is not recommended that you implement this for your package at this stage. Utility for simplifying export of results to files from sql queries

Note that this utility is not strictly thread safe though separate processes can export separate tables without issue. When exporting a the same table across multiple threads primary key checks may create issues.

Public fields

exportDir directory path to export files to

Methods

Public methods:

- [ResultExportManager\\$new\(\)](#)
- [ResultExportManager\\$getTableSpec\(\)](#)
- [ResultExportManager\\$getMinColValues\(\)](#)
- [ResultExportManager\\$checkRowTypes\(\)](#)
- [ResultExportManager\\$listTables\(\)](#)
- [ResultExportManager\\$checkPrimaryKeys\(\)](#)
- [ResultExportManager\\$exportDataFrame\(\)](#)
- [ResultExportManager\\$exportQuery\(\)](#)
- [ResultExportManager\\$getManifestList\(\)](#)
- [ResultExportManager\\$writeManifest\(\)](#)
- [ResultExportManager\\$clone\(\)](#)

Method new(): Create a class for exporting results from a study in a standard, consistent manner

Usage:

```
ResultExportManager$new(
  tableSpecification,
  exportDir,
  minCellCount = getOption("ohdsi.minCellCount", default = 5),
  databaseId = NULL
)
```

Arguments:

tableSpecification Table specification data.frame

exportDir Directory files are being exported to

minCellCount Minimum cell count - recommended that you set with options("ohdsi.minCellCount" = count) in all R projects. Default is 5

databaseId database identifier - required when exporting according to many specs get table spec

Method getTableSpec(): Get specification of table

Usage:

```
ResultExportManager$getTableSpec(exportTableName)
```

Arguments:

exportTableName table name Get min col values

Method getMinColValues(): Columns to convert to minimum for a given table name

Usage:

```
ResultExportManager$getMinColValues(rows, exportTableName)
```

Arguments:

rows data.frame of rows

exportTableName string table name - must be defined in spec Check row types

Method checkRowTypes(): Check types of rows before exporting

Usage:

```
ResultExportManager$checkRowTypes(rows, exportTableName)
```

Arguments:

rows data.frame of rows to export

exportTableName table name List tables

Method listTables(): list all tables in schema Check primary keys of exported data

Usage:

```
ResultExportManager$listTables()
```

Method checkPrimaryKeys(): Checks to see if the rows conform to the valid primary keys If the same table has already been checked in the life of this object set "invalidateCache" to TRUE as the keys will be cached in a temporary file on disk.

Usage:

```
ResultExportManager$checkPrimaryKeys(
  rows,
  exportTableName,
  invalidateCache = FALSE
)
```

Arguments:

rows data.frame to export
 exportTableName Table name (must be in spec)
 invalidateCache logical - if starting a fresh export use this to delete cache of primary keys
 Export data frame

Method exportDataFrame(): This method is intended for use where exporting a data.frame and not a query from a rdbms table For example, if you perform a transformation in R this method will check primary keys, min cell counts and data types before writing the file to according to the table spec

Usage:

```
ResultExportManager$exportDataFrame(rows, exportTableName, append = FALSE)
```

Arguments:

rows Rows to export
 exportTableName Table name
 append logical - if true will append the result to a file, otherwise the file will be overwritten
 Export Data table with sql query

Method exportQuery(): Writes files in batch to stop overflowing system memory Checks primary keys on write Checks minimum cell count

Usage:

```
ResultExportManager$exportQuery(
  connection,
  sql,
  exportTableName,
  transformFunction = NULL,
  transformFunctionArgs = list(),
  append = FALSE,
  ...
)
```

Arguments:

connection DatabaseConnector connection instance
 sql OHDSI sql string to export tables
 exportTableName Name of table to export (in snake_case format)
 transformFunction (optional) transformation of the data set callback. must take two paramters
 - rows and pos
 Following this transformation callback, results will be verified against data model,
 Primary keys will be checked and minCellValue rules will be enforced
 transformFunctionArgs arguments to be passed to the transformation function
 append Logical add results to existing file, if FALSE (default) creates a new file and removes
 primary key validation cache
 ... extra parameters passed to sql get manifest list

Method getManifestList(): Create a meta data set for each collection of result files with sha256 has for all files

Usage:

```
ResultExportManager$getManifestList(
  packageName = NULL,
  packageVersion = NULL,
  migrationsPath = NULL,
  migrationRegexp = .defaultMigrationRegexp
)
```

Arguments:

packageName if an R analysis package, specify the name
 packageVersion if an analysis package, specify the version
 migrationsPath path to sql migrations (use top level folder (e.g. sql/sql_server/migrations)
 migrationRegexp (optional) regular expression to search for sql files. It is not recommended to change the default. Write manifest

Method writeManifest(): Write manifest json

Usage:

ResultExportManager\$writeManifest(...)

Arguments:

... @seealso getManifestList

Method clone(): The objects of this class are cloneable with this method.

Usage:

ResultExportManager\$clone(deep = FALSE)

Arguments:

deep Whether to make a deep clone.

| | |
|--------------|---|
| unzipResults | <i>Unzips a results.zip file and enforces standards required by uploadResults</i> |
|--------------|---|

Description

This function will unzip the zipFile to the resultsFolder and assert that the file resultsDataModel-Specification.csv exists in the resultsFolder to ensure that it will work with uploadResults

Usage

```
unzipResults(zipFile, resultsFolder)
```

Arguments

| | |
|---------------|---|
| zipFile | The location of the .zip file that holds the results to upload |
| resultsFolder | The folder to use when unzipping the .zip file. If this folder does not exist, this function will attempt to create the folder. |

uploadResults

*Upload results to the database server.***Description**

Requires the results data model tables have been created using following the specifications, generateSqlSchema function.

Results files should be in the snake_case format for table headers and not camelCase

Set the POSTGRES_PATH environmental variable to the path to the folder containing the psql executable to enable bulk upload (recommended).

Usage

```
uploadResults(
  connection = NULL,
  connectionDetails = NULL,
  schema,
  resultsFolder,
  tablePrefix = "",
  forceOverWriteOfSpecifications = FALSE,
  purgeSiteDataBeforeUploading = TRUE,
  databaseIdentifierFile = "cdm_source_info.csv",
  runCheckAndFixCommands = FALSE,
  warnOnMissingTable = TRUE,
  purgeDataModel = FALSE,
  specifications
)
```

Arguments

- | | |
|--------------------------------|--|
| connection | An object of type connection as created using the connect function in the DatabaseConnector package. Can be left NULL if connectionDetails is provided, in which case a new connection will be opened at the start of the function, and closed when the function finishes. |
| connectionDetails | An object of type connectionDetails as created using the createConnectionDetails function in the DatabaseConnector package. |
| schema | The schema on the postgres server where the tables have been created. |
| resultsFolder | The path to the folder containing the results to upload. See unzipResults for more information. |
| tablePrefix | String to prefix table names with - default is empty string |
| forceOverWriteOfSpecifications | If TRUE, specifications of the phenotypes, cohort definitions, and analysis will be overwritten if they already exist on the database. Only use this if these specifications have changed since the last upload. |
| purgeSiteDataBeforeUploading | If TRUE, before inserting data for a specific databaseId all the data for that site will be dropped. This assumes the results folder contains the full data for that data site. |

databaseIdentifierFile

File contained that references databaseId field (used when purgeSiteDataBefore-Uploading == TRUE). You may specify a relative path for the cdmSourceFile and the function will assume it resides in the resultsFolder. Alternatively, you can provide a path outside of the resultsFolder for this file.

runCheckAndFixCommands

If TRUE, the upload code will attempt to fix column names, data types and duplicate rows. This parameter is kept for legacy reasons - it is strongly recommended that you correct errors in your results where those results are assembled instead of relying on this option to try and fix it during upload.

warnOnMissingTable

Boolean, print a warning if a table file is missing.

purgeDataModel This function will purge all data from the tables in the specification prior to upload. Use with care. If interactive this will require further input.

specifications A tibble data frame object with specifications.
